

# *The Entity- Relationship Model*

Course Instructor-  
*Dr. Koushlendra Kumar Singh*  
Assistant Professor

Department of Computer Science and Engineering  
National Institute of Jamshedpur- Jharkhand

---

**Note:** Students who enrolled in this course, Please mail me for any doubt related to this content-  
[koushlendra.cse@nitjsr.ac.in](mailto:koushlendra.cse@nitjsr.ac.in)

# ***Review***

---

- **Query Optimization**
  - Some resources, see slides
- **Finished discussing SQL**
  - Insert
  - Delete
  - Update
  - Null Values – Outer Joins
  - Views
  - Order By
  - Access Control
  - Integrity Constraints

# ***Review***

---

- **Data Modelling**
  - Relational
  - E-R
- **Storing Data**
  - File Indexes
  - Buffer Pool Management
- **Query Languages**
  - SQL
  - Relational Algebra
  - Relational Calculus
- **Query Optimization**
  - External Sorting
  - Join Algorithms
  - Query Plans, Cost Estimation

# Topics to be covered

---

## Concepts/Constructs in ER Approach and diagram

Cardinality vs. Participation Constraint

Weak Entity Type, EX/ID Relationship Types, generalization and specialization

Some extensions: Aggregation, Multiple FDs Representation

## English Sentence Structure and ER Diagram o self study

## ER Construct Notation Comparison

## Database Schema Design using ER Approach

## Translation of a (Normal Form) ER Diagram to a RDB

## A Normal Form for ER Diagram

# The ER Model

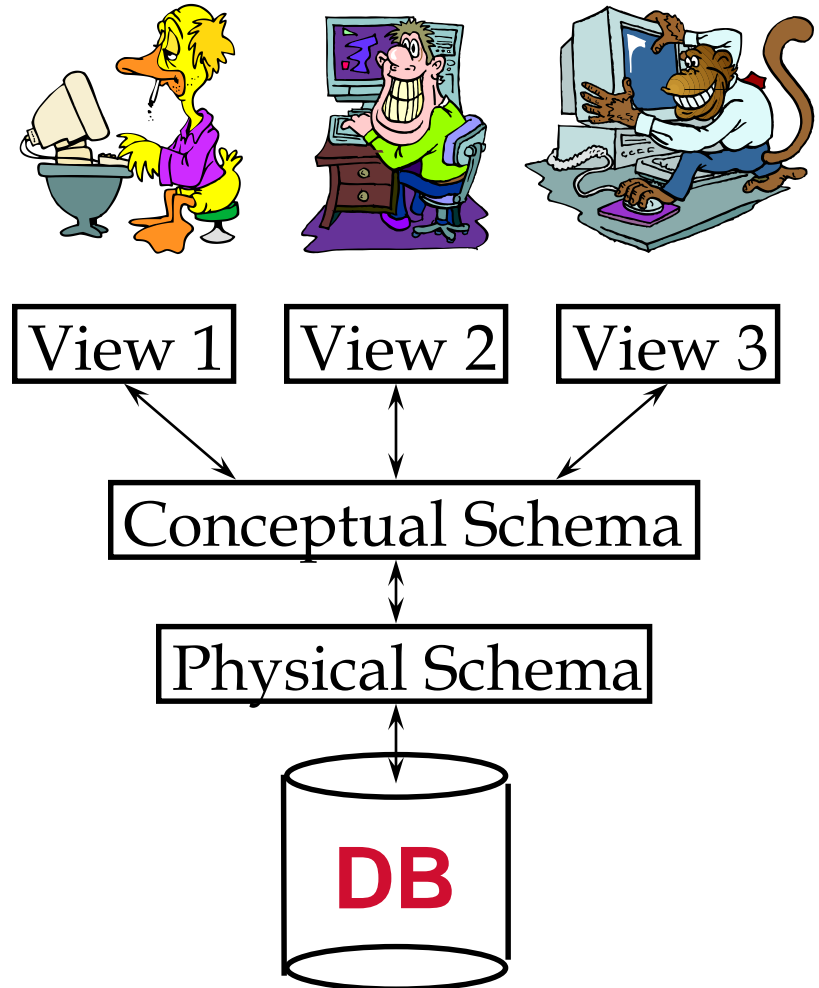

---

- **Discussed briefly in Initial Class lectures**
- **A different data model from Relational**
- **Most commonly used for database design**
- **Details of the ER Model**
- **Next, Translating ER Schemas to Relational**

# Review: Levels of Abstraction

- Views describe how users see the data.
- Conceptual schema defines logical structure
- Physical schema describes the files and indexes used.
- E-R Model most often appears at the View level, with the Relation Model at the Conceptual level
- Some systems exist that use ER model as Conceptual Model

## Users

# Databases Model the Real World

---

- “Data Model” translates real world things into structures computers can store
- **Many models:**
  - Relational, E-R, O-O, Network, Hierarchical, etc.
- **Relational**
  - Rows & Columns
  - Keys & Foreign Keys to link Relations

## Enrolled

sid	cid	grade
53666	Carnatic101	C
53666	Reggae203	B
53650	Topology112	A
53666	History105	B

## Students

sid	name	login	age	gpa
53666	Jones	jones@cs	18	3.4
53688	Smith	smith@eecs	18	3.2
53650	Smith	smith@math	19	3.8

# A Problem with the Relational Model

---

```
CREATE TABLE Enrolled
(sid CHAR(20),
 cid CHAR(20),
 grade CHAR(2))
```

```
CREATE TABLE Students
(sid CHAR(20),
 name CHAR(20),
 login CHAR(10),
 age INTEGER,
 gpa FLOAT)
```

With complicated schemas, it may be hard for a person to understand the structure from the data definition.

## Enrolled

cid	grade	sid
Carnatic101	C	53666
Reggae203	B	53666
Topology112	A	53650
History105	B	53666

## Students

sid	name	login	age	gpa
53666	Jones	jones@cs	18	3.4
53688	Smith	smith@eecs	18	3.2
53650	Smith	smith@math	19	3.8

# One Solution: The E-R Model

---

- **Instead of relations, it has:**  
Entities and Relationships
- **These are described with diagrams,**  
both structure, notation more obvious to humans

# Steps in Database Design

---

- Requirements Analysis
  - user needs; what must database do?
- Conceptual Design
  - high level descr (often done w/ER model)
- Logical Design
  - translate ER into DBMS data model
- Schema Refinement
  - consistency, normalization
- Physical Design
  - indexes, disk layout
- Security Design
  - who accesses what, and how

# Conceptual Design

---

- Define enterprise *entities* and *relationships*
- What information about entities and relationships should be in database?
- What are the *integrity constraints* or *business rules* that hold?
- A database 'schema' in the ER Model can be represented pictorially (*ER diagrams*).
- Can map an ER diagram into a relational schema.

# ER Model Basics

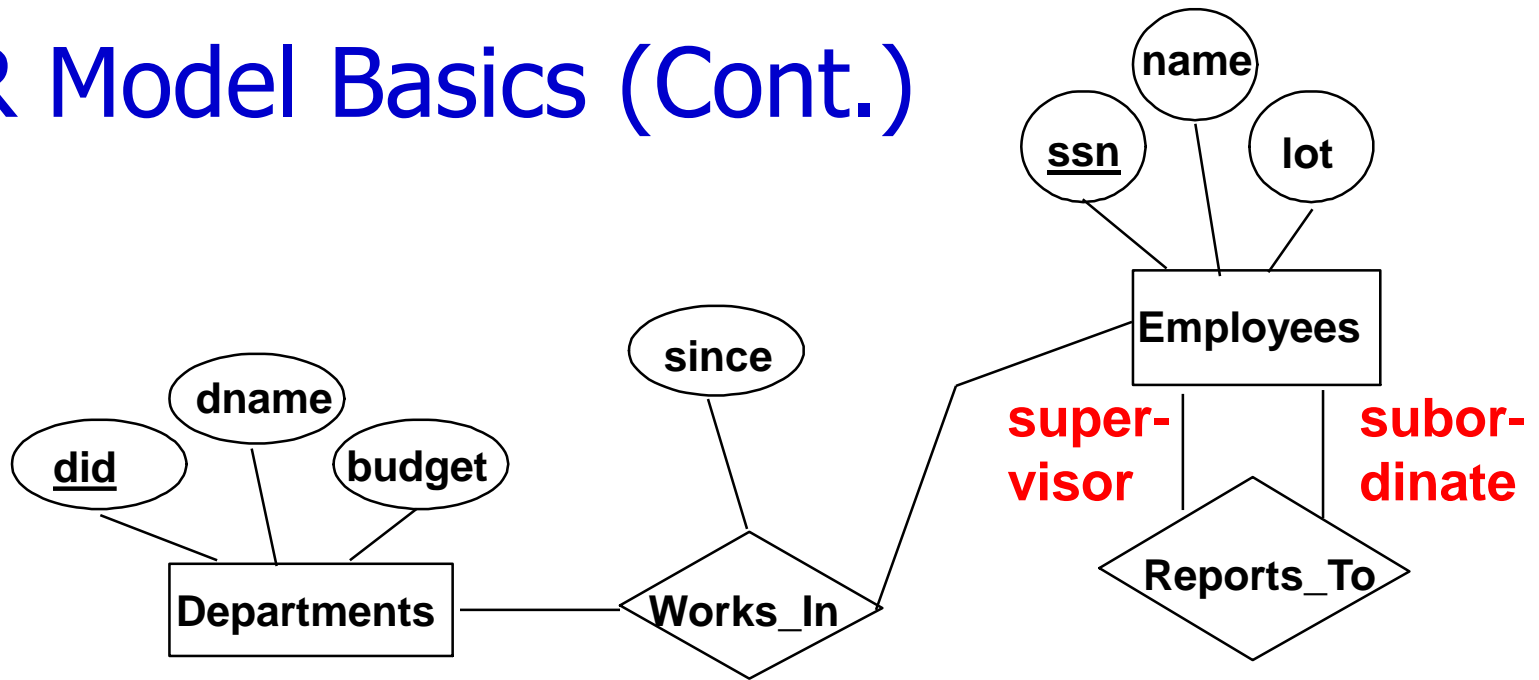

- **Entity:**  
Real-world thing, distinguishable from other objects.  
Entity described by set of *attributes*.
- **Entity Set:** A collection of similar entities. E.g., all employees.
  - All entities in an entity set have the same set of attributes. (Until we consider hierarchies, anyway!)
  - Each entity set has a *key* (*underlined*).
  - Each attribute has a *domain*.

# ER Model Basics (Contd.)

- **Relationship:** Association among two or more entities. E.g., Attishoo works in Pharmacy department.
  - relationships can have their own attributes.
- **Relationship Set:** Collection of similar relationships.
  - An  $n$ -ary relationship set  $R$  relates  $n$  entity sets  $E_1 \dots E_n$ ; each relationship in  $R$  involves entities  $e_1 \in E_1, \dots, e_n \in E_n$

# ER Model Basics (Cont.)

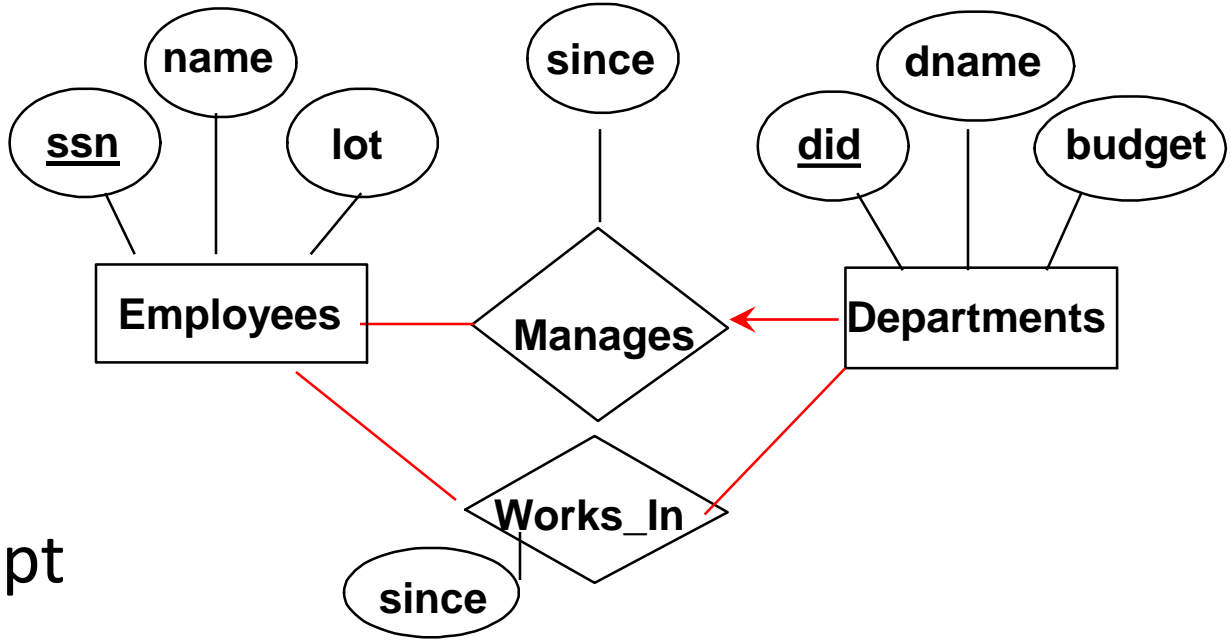

Same entity set can participate in different relationship sets, or in different “roles” in the same set.

# Key Constraints

An employee can work in **many** departments; a dept can have **many** employees.

In contrast, each dept has **at most one** manager, according to the key constraint on Manages.

**Many-to-Many**

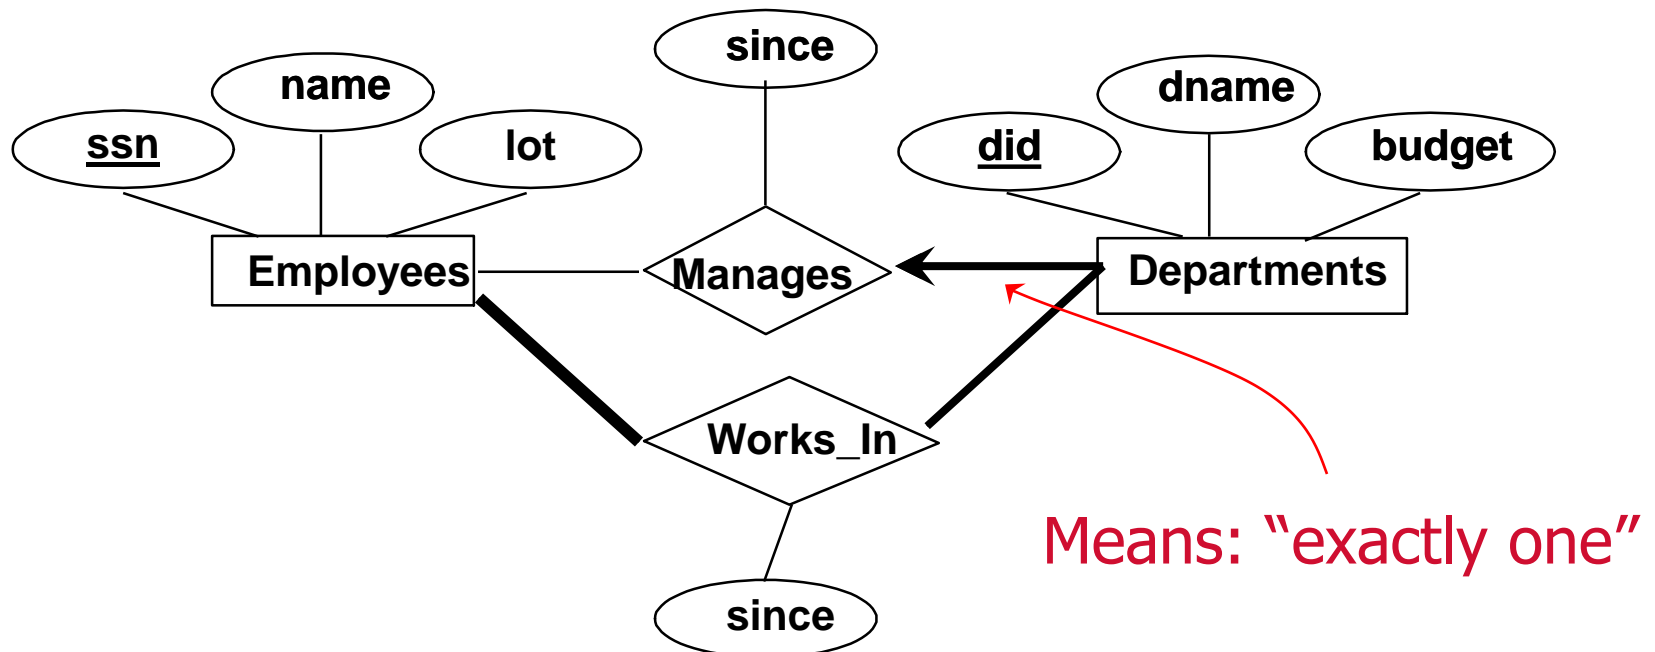

**1-to Many**

**1-to-1**

# Participation Constraints

- Does every employee work in a department?
- If so, this is a *participation constraint*
  - the participation of Employees in Works\_In is said to be *total (vs. partial)*
  - What if every department has an employee working in it?
- Basically means “at least one”

# Weak Entities

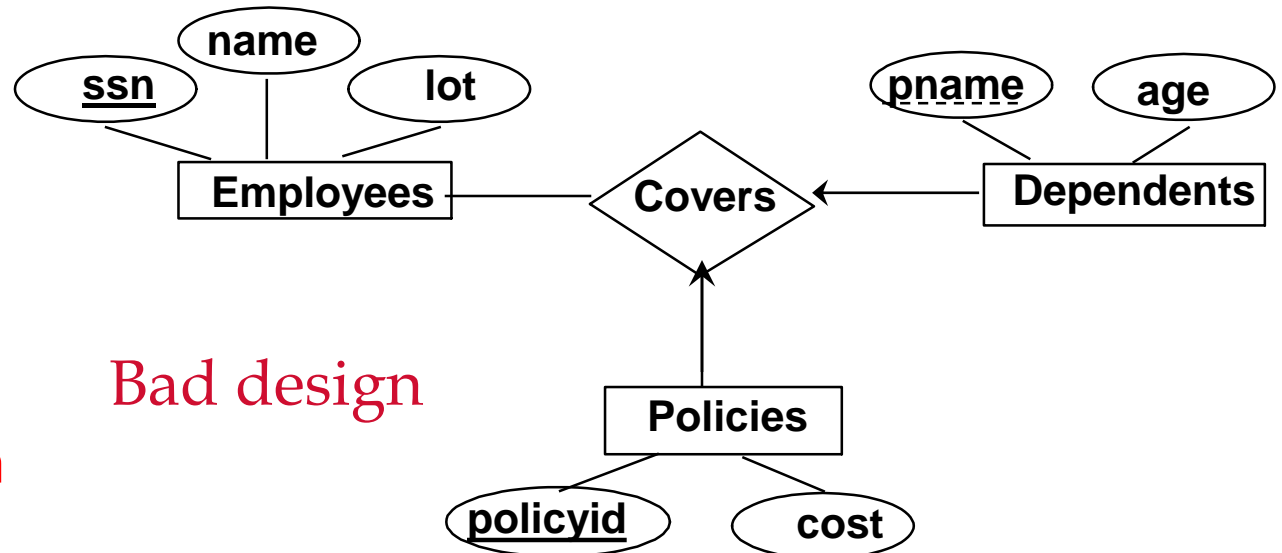

A ***weak entity*** can be identified uniquely only by considering the primary key of another (***owner***) entity.

- Owner entity set and weak entity set must participate in a one-to-many relationship set (one owner, many weak entities).
- Weak entity set must have total participation in this ***identifying*** relationship set.

Weak entities have only a “partial key” (dashed underline)

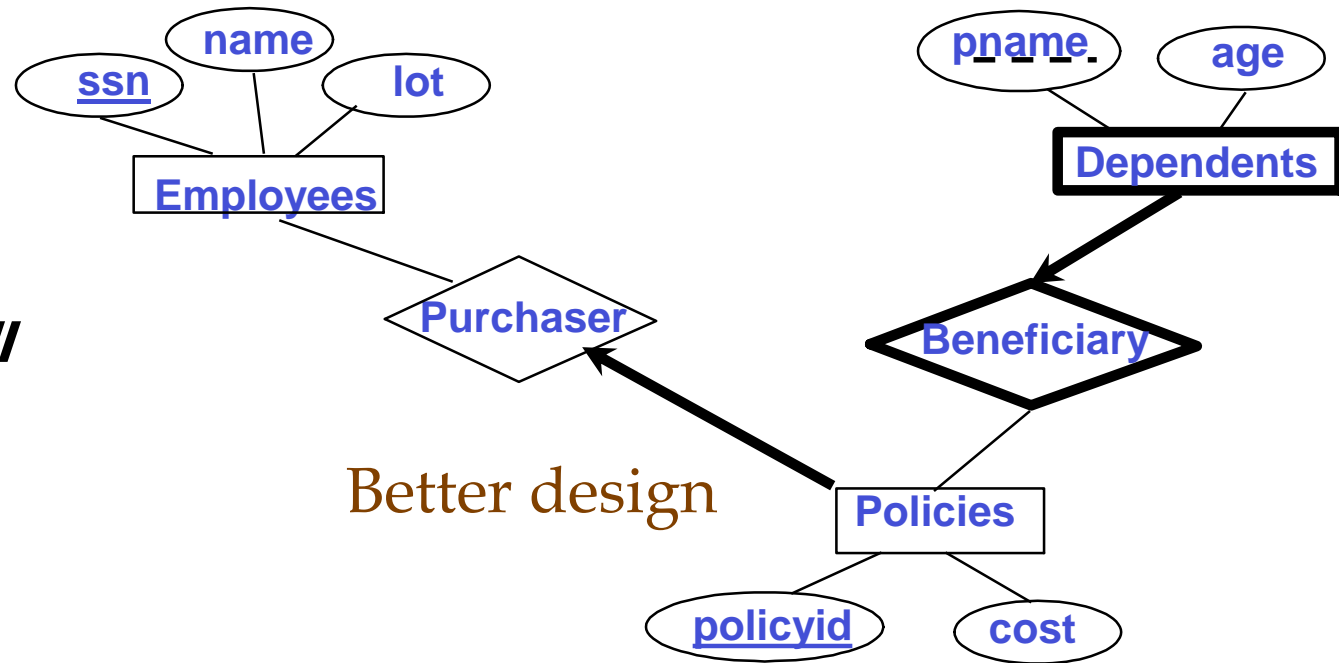

# Binary vs. Ternary Relationships

Bad design

If each policy is owned by just 1 employee:

Key constraint on Policies would mean policy can only cover 1 dependent!

Better design

• Think through *all* the constraints in the 2nd diagram!

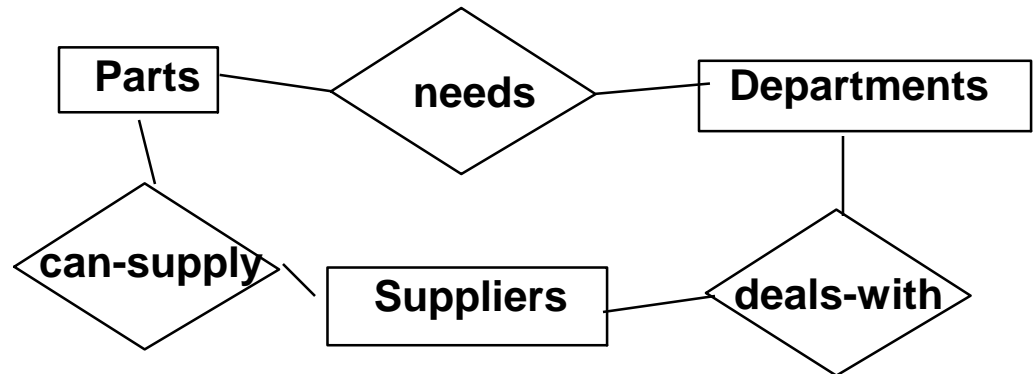

## Binary vs. Ternary Relationships (Contd.)

- Previous example illustrated case when two binary relationships were better than one ternary relationship.
- Opposite example: a ternary relation **Contracts** relates entity sets **Parts**, **Departments** and **Suppliers**, and has descriptive attribute *qty*. No combination of binary relationships is an adequate substitute.

# Binary vs. Ternary Relationships (Contd.)

**VS.**

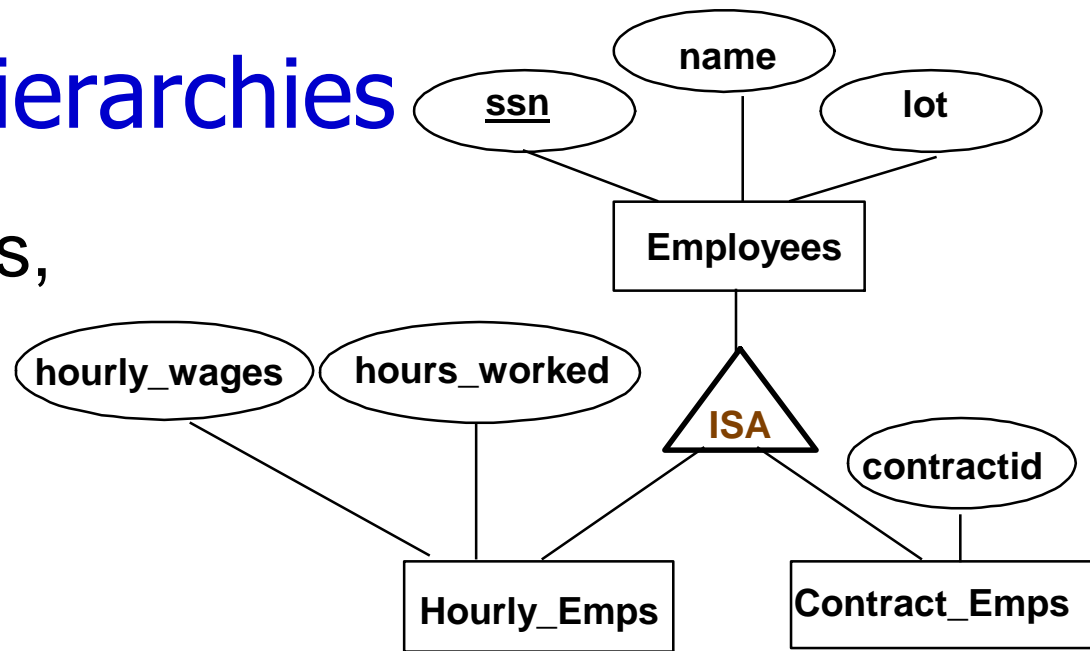

- S "can-supply" P, D "needs" P, and D "deals-with" S does not imply that D has agreed to buy P from S.
- How do we record *qty*?

# Summary so far

- **Entities and Entity Set (boxes)**
- **Relationships and Relationship sets (diamonds)**
  - binary
  - n-ary
- **Key constraints (1-1,1-M, M-M, arrows on 1 side)**
- **Participation constraints (bold for Total)**
- **Weak entities - require strong entity for key**
- **Next, a couple more “advanced” concepts...**

# ISA ('is a') Hierarchies

□ As in C++, or other PLs, attributes are inherited.

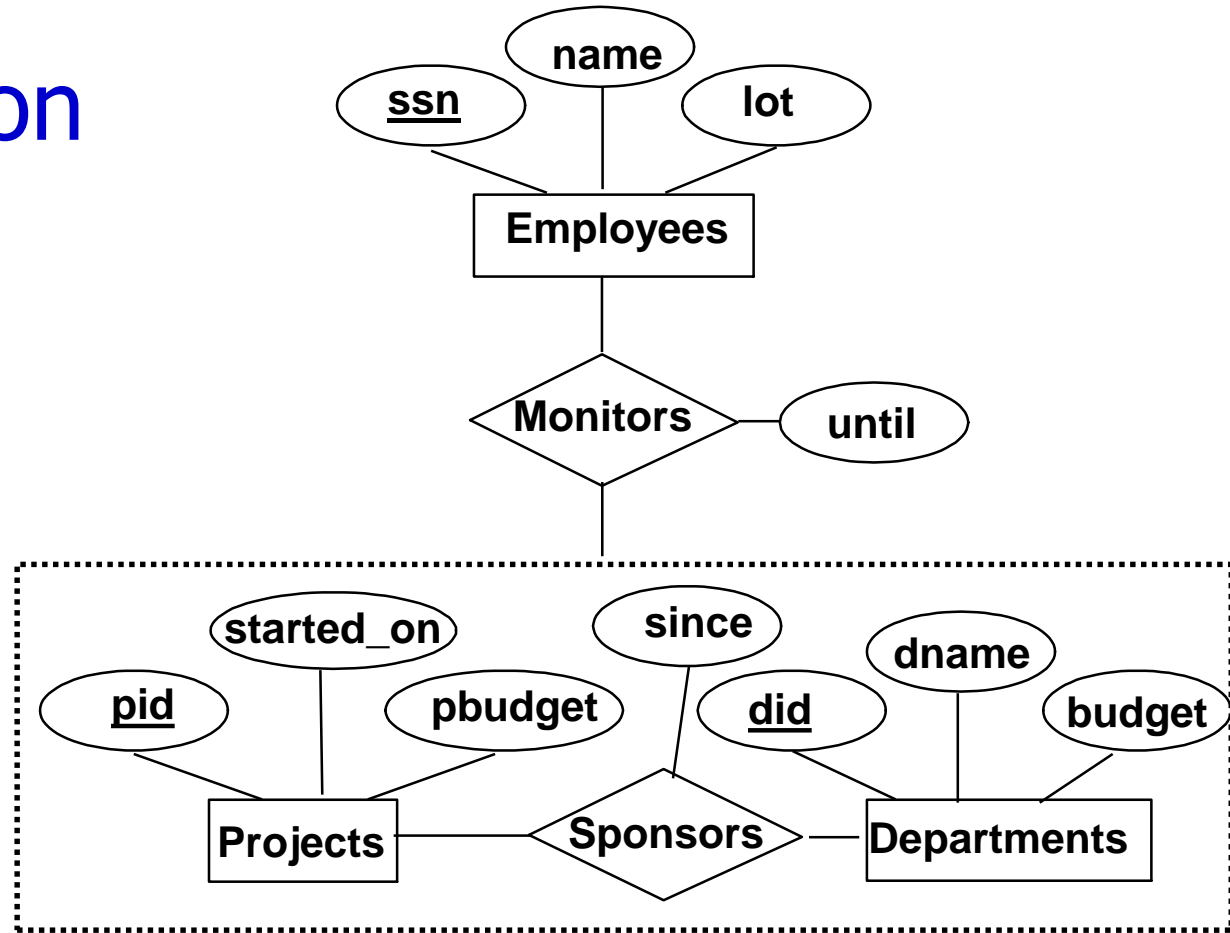

□ If we declare A **ISA** B, every A entity is also considered to be a B entity.

- **Overlap constraints:** Can Simon be an Hourly\_Emps as well as a Contract\_Emps entity? (*Allowed/disallowed*)
- **Covering constraints:** Does every Employees entity also have to be an Hourly\_Emps or a Contract\_Emps entity? (*Yes/no*)
- **Reasons for using ISA:**
  - To add descriptive attributes specific to a subclass.
    - i.e. not appropriate for all entities in the superclass
  - To identify entities that participate in a particular relationship
    - i.e., not all superclass entities participate

# Aggregation

Used to model a relationship involving a *relationship set*.

Allows us to **treat a relationship set as an entity set** for purposes of participation in (other) relationships.

## *Aggregation vs. ternary relationship?*

- Monitors is a distinct relationship, with a descriptive attribute.
- Also, can say that each sponsorship is monitored by at most one employee.

# Conceptual Design Using the ER Model

- ER modeling *can* get tricky!
- Design choices:
  - Should a concept be modeled as an **entity or an attribute**?
  - Should a concept be modeled as an **entity or a relationship**?
  - Identifying relationships: **Binary or ternary**? **Aggregation**?
- **Note constraints of the ER Model:**
  - A lot of data semantics can (and should) be captured.
  - But some constraints cannot be captured in ER diagrams.
    - We'll refine things in our logical (relational) design

# Entity vs. Attribute

- **Should *address* be:**
  - attribute of Employees or
  - an entity (related to Employees)?
- **Depends upon use of address information, and the semantics of the data:**
  - If **several addresses per employee**, *address* must be an entity (since attributes cannot be set-valued).
  - If **structure** (city, street, etc.) **is important**, *address* must be modeled as an entity (since attribute values are atomic).

# Entity vs. Attribute (Cont.)

- Works\_In2 does not allow an employee to work in a department for two or more periods.

- Similar to the problem of wanting to record several addresses for an employee: we want to record *several values of the descriptive attributes for each instance of this relationship.*

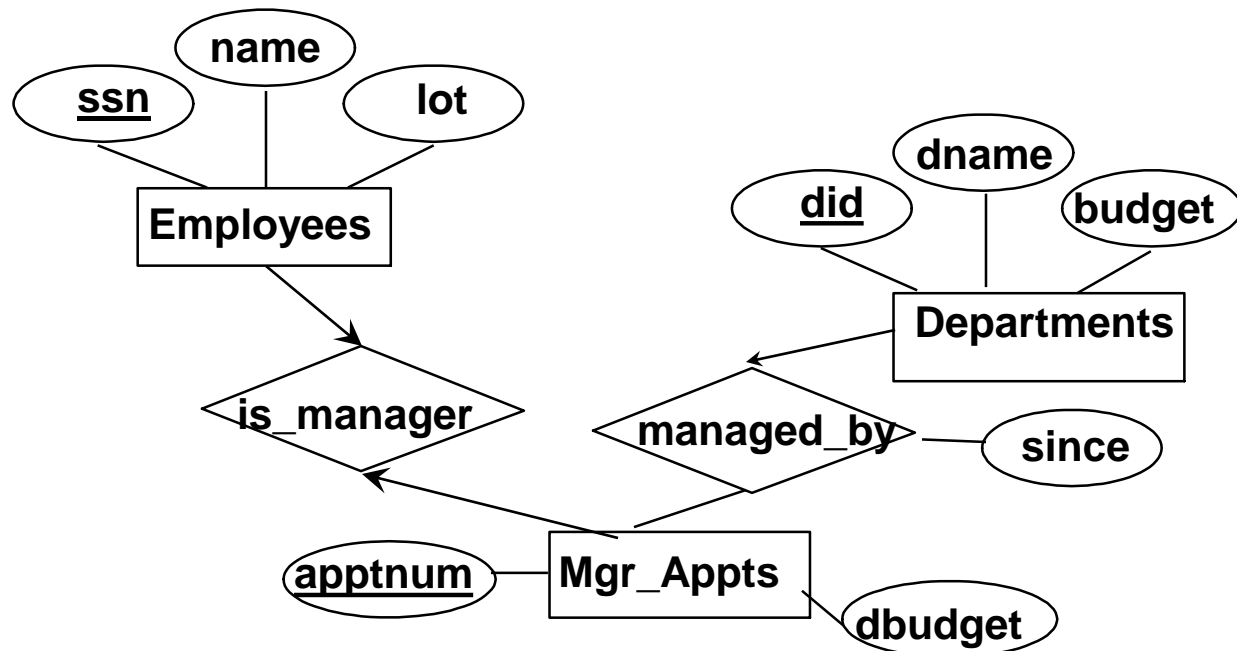

# Entity vs. Relationship

OK as long as a manager gets a separate discretionary budget (*dbudget*) for each dept.

What if manager's *dbudget* covers *all* managed depts?  
(can repeat value, but such redundancy is problematic)

# Now you try it

## **Try this at home - Courses database:**

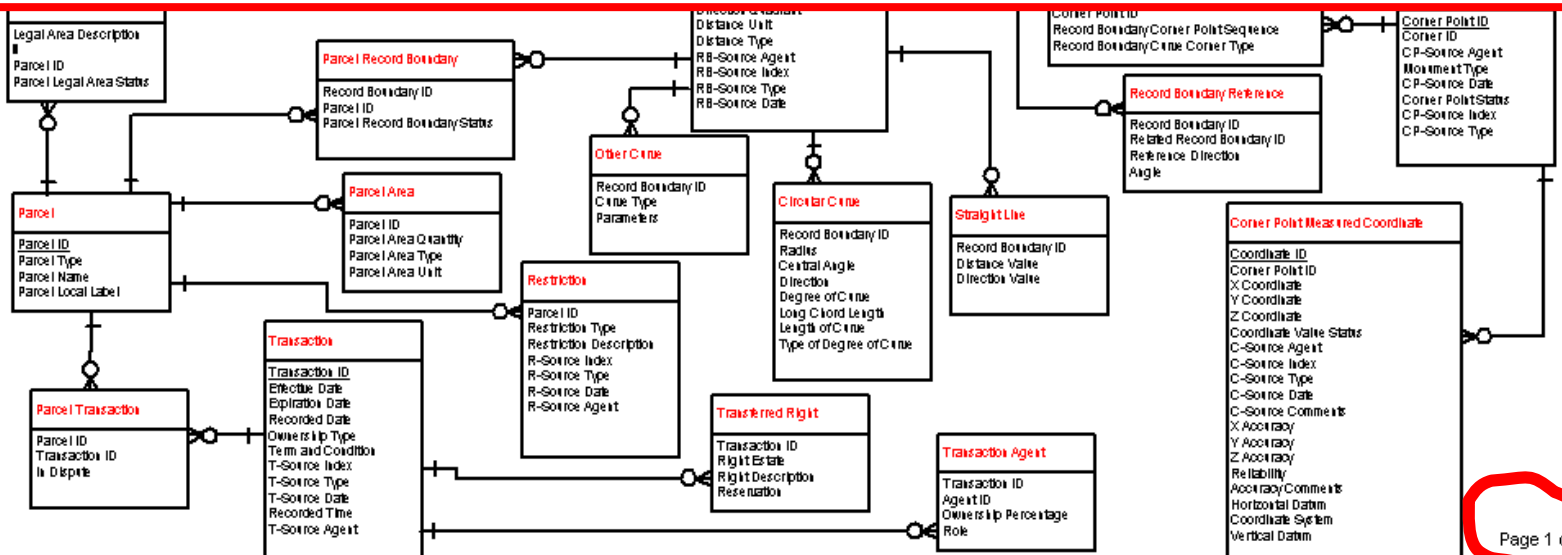

- **Courses, Students, Teachers**
- **Courses have ids, titles, credits, ...**
- **Courses have multiple sections that have time/rm and exactly one teacher**
- **Must track students' course schedules and transcripts including grades, semester taken, etc.**
- **Must track which classes a professor has taught**
- **Database should work over multiple semesters**

# A Cadastral E-R Diagram

**cadastral:** showing or recording property boundaries, subdivision lines, buildings, and related details

**Source:** US Dept. Interior Bureau of Land Management,  
Federal Geographic Data Committee Cadastral Subcommittee  
<http://www.fairview-industries.com/standardmodule/cad-erd.htm>

# Summary of Conceptual Design

- *Conceptual design* follows *requirements analysis*,
  - Yields a high-level description of data to be stored
- ER model popular for conceptual design
  - expressive constructs
  - close to how people think
  - Note: Many variations on ER model, Both graphically and conceptually
- Basic constructs:
  - *entities*,
  - *relationships*, and
  - *attributes* (of entities and relationships).
- Some additional constructs:
  - *weak entities*,
  - *ISA hierarchies*, and
  - *aggregation*.

# Summary of ER (Cont.)

- Several kinds of integrity constraints:
  - *key constraints*
  - *participation constraints*
  - *overlap/covering* for ISA hierarchies.
- Some *foreign key constraints* are also implicit in the definition of a relationship set.
- Many other constraints (notably, *functional dependencies*) cannot be expressed.
- Constraints play an important role in determining the best database design for an enterprise.

# Summary of ER (Cont.)

- ER design is *subjective*.
  - often many ways to model a given scenario!
- Analyzing alternatives can be tricky, especially for a large enterprise. Common choices include:
  - Entity vs. attribute,
  - entity vs. relationship,
  - binary or n-ary relationship,
  - whether or not to use ISA hierarchies,
  - aggregation.
- Ensuring good database design: resulting relational schema should be analyzed and refined further.
  - Functional Dependency information and normalization techniques are especially useful.
